Resolution No.: AC/

Bharatiya Vidya Bhavan's

M. M. College of Arts, N.M. Institute of Science, H.R.J. College of Commerce

(Bhavan's College, Andheri West (Autonomous)

(Affiliated to University of Mumbai)

Revised Syllabus for T.Y.B.Sc.

Program: B.Sc.

Course: Microbiology (BHUSMB)

(Credit Based Semester and Grading System with effect from the academic year 2023 – 2024)

PREAMBLE

Choice Based Credit System (CBCS) was introduced by the University of Mumbai on recommendations of the University Grants Commission (UGC) from the academic year 2016-2017. Its main objective was to provide flexibility in designing curriculum and assigning credits based on the course contents and number of hours of teaching. The standing committee constituted by the UGC conferred Autonomous status to Bhavan's College, Andheri (affiliated to the University of Mumbai) for a period of 10 years with effect from the academic year 2019-20. In light of this, the F.Y.BSc. Curriculum was updated and has been implemented from the academic year 2021-22 and T.Y. BSc curriculum was updated and has been implemented from the academic year 2022-23. Subsequently, the process of restructuring the T.Y. BSc syllabus according to the CBCS pattern was initiated for its implementation from academic year 2023-24.

The T.Y. BSc degree course of Bachelor of Science (Choice Based Credit System) in Microbiology has been revised so as to cover fundamental and applied knowledge on the important fields of Microbiology viz - Immunology, Genetics, Biochemistry, Medical Microbiology and Industrial Microbiology. The students opting this course will get an enhanced theoretical and practical knowledge in the above fields. The course will empower the students with the necessary skill-set essential in a Microbiology Laboratory.

Thus, the board of studies for Microbiology has approved the T.Y. BSc syllabus for its implementation in 2023-24.

PROGRAM OUTCOMES

A student completing Bachelor's Degree in Science program will be able to:

- 1. Develop a strong understanding about the fundamental concepts and principles of the wide areas spanning the subject of Microbiology.
- 2. Demonstrate proficiency in basic and advanced laboratory techniques that are required at Industrial levels.
- 3. Improve critical thinking & observation skills through the robust practical sessions involving diverse applications of Microbes.
- 4. Work cohesively in teams and demonstrate appropriate interpretation skills and documentation capabilities.
- 5. Become knowledgeable citizens of the country who can make their successful careers in diverse fields of Microbiology and Applied Research thereby contributing to the progress and development of the Nation.

PROGRAM SPECIFIC OUTCOMES

A student completing T.Y.B. Sc Course in the Bachelor's Degree Program with the subject of Microbiology will be able to:

- 1. Understand the basic concepts and applications of diverse disciplines of Microbiology viz Microbial Genetics, Medical Microbiology, Immunology, and Microbial Biochemistry.
- 2. Become aware about the applied subjects of Microbiology like Food Microbiology, Industrial Microbiology and describe the role of microbes in Food industry and Industrial Fermentations.
- 3. Gain thoughtful knowledge and expertise in handling pathogenic and non-pathogenic microorganisms in the laboratory and also exploring their characteristics.
- 4. Appreciate and understand the allied concepts of Bioinformatics, IPR, Tissue Culture and recombinant DNA technology.

LEARNING OBJECTIVES - MICROBIAL GENETICS [BH. USMB501]

Microbial Genetics (USMB-501) is a course in Genetics for T.Y.B.Sc. undergraduate students in Semester V that deals with various concepts of Genetics.

The learning objectives include the following:

DNA Replication: The learner will understand the events occurring in both Prokaryotic and Eukaryotic DNA replication, with a focus on the involvement of Proteins and Enzymes at the cellular level. The topic will also include the assembly of Eukaryotic chromosome.

Transcription, Genetic Code and Translation: This module aims at the learner understanding the basis of gene expression and the Central Dogma and the molecular basis of protein synthesis in Prokaryotes and Eukaryotes. The module deals with the structure and properties of different forms of RNA, maturation of RNA and RNA splicing.

Mutation and DNA repair: The molecular basis and types of mutation, their cause, effect and DNA repair is studied. The basic concepts related to molecular biology are explained.

Virology: This module deals with basic structure and life cycle of different viruses and cultivation of viruses. It also comprises of various methods used for visualization and enumeration of virus particles and also the role of viruses in causing cancer.

LEARNING OUTCOMES:

DNA Replication: The learner will understand the sequence of events, mechanism, enzymes and proteins involved in replication of DNA in prokaryotes and eukaryotes.

Transcription, Genetic Code and Translation: The student will know the central dogma of biology its two-step transcription and translation, maturation of RNA.

Mutation and DNA repair: The learner will know the concept of mutation, its types, causes and their effects. This module will also make them understand types of mutagens, damage to DNA due to mutagenesis, various mechanisms of DNA repair.

Virology: The learner will understand the basic structure and life cycle of different viruses and their cultivation. The student will get basic knowledge on Prions, Viroid and viruses causing cancer.

MICROBIAL GENETICS [BH. USMB501] - DETAILED SYLLABUS

Course Code	Unit	Sub unit	Title	No of lectures	Credi t
BHUSMB501			MICROBIAL GENETICS	60	2.5
	I		DNA REPLICATION	15	
		1.1	Introduction	1L	
		1.2	Modes of DNA Replication - Conservative, dispersive, semi- conservative, bidirectional and semi-discontinuous	2 L	
		1.3	Models of DNA Replication: - Theta model of replication & Rolling circle mode of DNA replication	2 L	
		1.4	Prokaryotic DNA replication - Details of molecular mechanisms involved in Initiation, Elongation and Termination	4L	

	I	<u> </u>		I
	1.5	Enzymes and proteins associated with DNA replication- Primase, Helicase, Topoisomerase, SSB, DNA polymerases, Ligases, Ter and Tus proteins.	2 L	
	1.6	Eukaryotic DNA replication - Molecular details of DNA synthesis, replicating the ends of the chromosomes assembling newly replicated DNA into nucleosomes.	3L	
II		TRANSCRIPTION, GENETIC CODE & TRANSLATION	15L	
	2.1	Central Dogma: An Overview, Transcription process	1L	
	2.2	Transcription in bacteria - Initiation of transcription at promoters, elongation of an RNA chain, termination of an RNA chain	2L	
	2.3	Transcription in Eukaryotes - Eukaryotic RNA polymerase, Transcription of protein- coding genes by RNA polymerase II, Transcription initiation, the structure and production of Eukaryotic mRNAs, Production of mature mRNA in Eukaryotes, Processing of Pre-mRNA to mature mRNA. Self-Splicing of Introns, RNA editing	3L	
	2.4	Genetic code - Nature of genetic code and characteristics of genetic code.	2L	
	2.5	Translation process - Transfer RNA, structure of tRNA, tRNA genes, Recognition of the tRNA anticodon by the mRNA codon, Adding of amino acid to tRNA, Ribosomal RNA and Ribosomes, Ribosomal RNA Genes, Initiation of translation, Initiation in Bacteria, Initiation in eukaryotes, Elongation of the polypeptide chain, termination of translation, protein sorting in the cell	7L	
III		MUTATION AND REPAIR		
	3.1	Mutation Terminology: alleles, homozygous, heterozygous, genotype, phenotype, Somatic mutation, Germline mutation, Gene mutation, Chromosome mutation, phenotypic lag, hotspots and mutator genes.	2L	
	3.2	Types of mutations: Point mutation, reverse mutation, suppressor mutation, frame shift mutation, conditional lethal mutation, base pair substitution, transition, transversion, missense mutation, nonsense mutation, silent mutation, neutral mutation, pleiotropic mutations.	2L	
	3.3	Causes of mutation: Natural/spontaneous mutation-replication error, depurination, deamination. Induced mutation: principle and mechanism with illustrative diagrams for:	2L	
	3.4	 a. Chemical mutagens - base analogues, nitrous acid, hydroxyl amine, intercalating agents and alkylating agents. b. Physical mutagens c. Biological mutagens (only examples) 	3L	

	3.5	a. Fluctuation test.b. Ames testc. Detection of mutants	3L	
	3.6	 DNA Repair a. Light repair: - Photoreactivation b. Dark Repair: - Nucleotide excision repair c. List other repair mechanisms. 	3L	
IV		VIROLOGY		
	4.1	Structure of TMV, Influenza virus and HIV	2L	
	4.2	Life cycle of TMV, Influenza Virus and HIV.	3L	
	4.3	Cultivation of viruses- Cell culture techniques & Embryonated egg	2L	
	4.4	Visualization and enumeration of virus particles Measurement of infectious units:- a. One step growth curve of bacteriophages b. Endpoint dilution assay c. Fluorescent focus assay [principle] d. Infectious center assay [principle] e. Transformation assay [principle]	3L	
	4.5	Measurement of virus particles and their components a. Electron microscopy [principle] b. Atomic force microscopy [principle] c. Haemagglutination assay. d. Measurement of viral enzyme activity	2L	
	4.6	Role of viruses in cancer a. Important Definitions, Characteristics of cancer cell b. Human DNA tumor viruses: - EBV, Kaposi sarcoma virus, Papilloma virus	3L	

Course Code: BHUSMBP05

[Practicals Based on BH. USMB501, Credits -1.5, Lectures- 60, Notional Periods-15]

- 1. UV survival curve determination of exposure time leading to 90% reduction, Light repair & dark repair effect.
- 2. Isolation of antibiotic resistant mutants using UV mutagenesis
- 3. Gradient plate technique (dye resistant mutant)
- 4. Replica plate technique for selection & characterization of mutants auxotroph & antibiotic resistant
- 5. One step growth curve of coliphage
- 6. Haemagglutination assay (Demo)

[BH. USMB502] -MEDICAL MICROBIOLOGY & IMMUNOLOGY - PART- I

LEARNING OBJECTIVES

The course in medical microbiology & Immunology has been designed to help students to build on the basic information regarding the host pathogen interactions and defense mechanisms that they have gained in S.Y.B.Sc. This course begins with a unit entirely based on chemotherapy that discusses various antimicrobial drugs and basic & advanced laboratory testing methods. It also covers various mechanisms used by pathogens in generation of multiple resistance strains. When dealing with infectious diseases, it is imperative for the students to learn about the logical thought process behind the diagnosis of various infections in the laboratory. With the world changing rapidly, newer and much advanced diagnostic techniques are slowly taking precedence. Taking cognizance of this, the second unit is designed which covers the preliminary [basic] and advanced diagnostic techniques. Immunology is an integral part of Medical Microbiology and this course is designed for T.Y.B.Sc. Microbiology students, on the assumption that the students have achieved a basic understanding of Innate Immunity and Host Defence Mechanisms in their lower classes. The two units of Immunology cover the basics of antigen, antibody, immunological reactions [applications] in addition to the concept of cytokines and the role of immunohematology in blood transfusion.

LEARNING OUTCOMES

After completing this course, the student should be able to

- 1. Understand the characteristics and mode of action of various antibiotics
- 2. Explain the concept and mechanisms used by pathogens to develop resistance to antibiotics.
- 3. Gather the basic understanding on the preliminary identification methods to diagnose an infectious disease in the laboratory.
- 4. Understand the principle and applications of various automated and molecular diagnostic techniques
- 5. Understand and explain the basic concepts of antigen, structure and function of antibody & their applications [antigen antibody reactions]
- 6. Explain the names and role/functions various signalling molecules and their receptors
- 7. Gather the basic understanding on the important concepts in Immunohematology and its applications

DETAILED SYLLABUS

Course Code	Unit	Sub unit	Title	No of lectures	Credit
BHUSMB 502			MEDICAL MICROBIOLOGY & IMMUNOLOGY – PART I	60	2.5
	I		ANTIMICROBIAL CHEMOTHERAPY	15	
		1.1	Antimicrobial Compounds – Safety Net of Modern Medicine a. Importance of antimicrobial compounds b. Killing v/s inhibiting growth	1L	
		1.2	Antibiotics a. Characteristics of antibiotics b. Process of antibiotic discovery c. Economics of antibiotic discovery	2L	
		1.3	Mechanism of Antibiotic action a. Targets of Antibiotic action b. Cell wall synthesis inhibitors c. Protein synthesis inhibitors d. Quinolones – inhibitors of DNA replication e. Rifampin – an Inhibitor of RNA synthesis f. Trimethoprim and Sulfonamides g. Metronidazole h. Newer antibiotics	7L	
		1.4	 Emerging Antibiotic resistance a. Mechanisms of antibiotic resistance – Overview b. Types of resistance – intrinsic and acquired c. Limiting access of the antibiotic d. Enzymatic inactivation of the antibiotic e. Active efflux of antibiotic f. Modification of the antibiotic target g. Antibiotic tolerance 	5L	
	II		DIAGNOSTIC MICROBIOLOGY	15	
			Preliminary Identification methods a) Sample collection requirements for specific sites – Respiratory tract, GI tract, Urine, Blood, CSF, Wound abscess b) Sample collection and processing c) Initial sample plating and identification – microscopic examination, selection and inoculation in primary media d) Preliminary biochemical tests – carbohydrate utilization, catalase, oxidase, coagulase, spot indole, PYR hydrolysis	5L	
			Automation, Immunodiagnostics & Molecular methods a. Multi test systemsb. Automated identification systems [Principles and application]	7L	

			,		
i .			c. Immunserological techniques [Principles and		
			applications]		
			d. Molecular techniques		
			 Production of nucleic acid probes 		
			 Detection of hybridization with labels and 		
			reporter molecules		
			 Preparation of target nucleic acid 		
			 Hybridization of target and probe 		
			Detection of hybridization & reaction fragments		
			e. Amplification methods		
			Amplification of nucleic acid, target amplification		
			 Application of PCR 		
			RFLP – significance only		
			 Nucleic acid sequencing – significance only 		
			Antimicrobial susceptibility testing		
			a) Disc diffusion method – Stoke's method & Kirby		
			Bauer method		
			b) Quantitative dilution susceptibility testing	21	
			c) Agar dilution susceptibility testing	3L	
			d) Microbroth dilution test		
			e) Serum bactericidal test		
			f) Ditch plate test		
	III		GENERAL IMMUNOLOGY I	15	
			Overview of the Immune System		
		3.1	a. Historical perspective of Immunology	3L	
			b. Basic concepts of mammalian immune response		
			c. Immune dysfunction and its consequences		
			Hematopoiesis a. Basic Concept of stem cell, progenitor cell and		
		3.2	lineages	3L	
		3.2	b. Regulation at genetic level	3L	
			c. Hematopoietic homeostasis and role of apoptosis		
			Antigens		
			1. Types of antigens – heterophile, isophile, sequestered and		
1			superantigens		
		3.3	1 1	4L	
		3.3	2. Epitopes	4L	
		3.3	2. Epitopesa. General Concept	4L	
		3.3	2. Epitopesa. General Conceptb. Properties of B cell epitopes	4L	
		3.3	2. Epitopesa. General Conceptb. Properties of B cell epitopesc. Properties of T cell epitopes	4L	
		3.3	 2. Epitopes a. General Concept b. Properties of B cell epitopes c. Properties of T cell epitopes Immunoglobulins	4L	
		3.3	 2. Epitopes a. General Concept b. Properties of B cell epitopes c. Properties of T cell epitopes Immunoglobulins a. Fine structure of antibody – concept of domains, heavy 	4L	
			 2. Epitopes a. General Concept b. Properties of B cell epitopes c. Properties of T cell epitopes Immunoglobulins a. Fine structure of antibody – concept of domains, heavy chains, light chains, CDRs, hypervariable regions 		
		3.3	 2. Epitopes a. General Concept b. Properties of B cell epitopes c. Properties of T cell epitopes Immunoglobulins a. Fine structure of antibody – concept of domains, heavy chains, light chains, CDRs, hypervariable regions b. Five major classes of antibody heavy chains 	4L 5L	
			 2. Epitopes a. General Concept b. Properties of B cell epitopes c. Properties of T cell epitopes Immunoglobulins a. Fine structure of antibody – concept of domains, heavy chains, light chains, CDRs, hypervariable regions 		
			 2. Epitopes a. General Concept b. Properties of B cell epitopes c. Properties of T cell epitopes Immunoglobulins a. Fine structure of antibody – concept of domains, heavy chains, light chains, CDRs, hypervariable regions b. Five major classes of antibody heavy chains c. Two major classes of antibody light chains 		
			 2. Epitopes a. General Concept b. Properties of B cell epitopes c. Properties of T cell epitopes Immunoglobulins a. Fine structure of antibody – concept of domains, heavy chains, light chains, CDRs, hypervariable regions b. Five major classes of antibody heavy chains c. Two major classes of antibody light chains d. Specific functions of domains of antibody heavy and 		
	IV		 2. Epitopes a. General Concept b. Properties of B cell epitopes c. Properties of T cell epitopes Immunoglobulins a. Fine structure of antibody – concept of domains, heavy chains, light chains, CDRs, hypervariable regions b. Five major classes of antibody heavy chains c. Two major classes of antibody light chains d. Specific functions of domains of antibody heavy and light chain d. Specific functions of domains of antibody heavy and light chain		

		Cytokines and chemokines		
		a. General properties of cytokines and chemokines		
		b. Six families of cytokines and their receptors		
		 Cytokines of IL-1 family & its receptors 		
	4.1	 Cytokines of hematopoietin class I family & its 	3L	
	4.1	receptors	SL	
		 Interferons cytokine family and its receptors 		
		 Cytokines of TNF family and its receptors 		
		 Cytokines of IL-17 family and its receptors 		
		 Chemokines – structure and receptors 		
		Immunological techniques – Principle & applications		
		a. Concepts of immunogen, antigen, affinity, avidity, cross		
		reactivity		
		b. Agglutination reactions		
	4.2	c. Precipitation reactions – Mancini's & Ouchterlony	5L	
	7.2	method	JL	
		d. Radioimmunoassay		
		e. ELISA – indirect and sandwich		
		f. Western blotting		
		g. Immunoelectron microscopy		
		Alternatives to antigen antibody reactions		
		Immunohematology		
		a. Concept of whole blood unit, anticoagulants, additive solutions, blood collection sets, components of blood,		
		washing and storage of RBCs		
		b. ABO blood group system – Inheritance, Antigen		
		development, Antibodies of ABO system, Secretor status,		
		subgroups of A and B		
	4.3	c. Testing methods - Forward typing, microplate & gel	7L	
		testing, reverse typing, molecular testing		
		d. Rh blood group system – Genes, Nomenclature, D antigen		
		& clinical significance of weak D and partial D antigen		
		e. Hemolytic disease of the fetus & newborn – maternal		
		alloimmunization, pathophysiology, assessing risk for		
		HDN, cord blood testing, serologic testing, prevention of		
		HDN		

Course Code: BHUSMBP05 [Practicals Based on BH. USMB502, Credits -1.5, Lectures- 60, Notional Periods-15]

- 1. Immunodiffusion by Mancini and Ouchterlony's method
- 2. Study of human blood groups and their grouping by Direct & Reverse typing
- 3. Determination of Isoagglutinin titer
- 4. Blood compatibility test.
- 5. Coomb's Direct test
- 6. Antibiotic sensitivity testing by Stoke's method & Kirby Bauer method
- 7. Determination of MIC and MBC of antibiotic.
- 8. Determination of antibacterial spectrum by Ditch plate technique

MICROBIAL BIOCHEMISTRY – PART I [BH. USMB503]

LEARNING OBJECTIVES

Biochemistry is the branch of science that explores the chemical processes that take place inside all living things, from bacteria to plants and animals. It is a laboratory-based science that brings together biology and chemistry, by using chemical knowledge and techniques to help understand and solve biological problems. Microbial physiology is best understood with knowledge of biochemistry. The course thus focuses on the need to study uptake, various intermediary metabolic processes and methods to study metabolism both invitro as well as invivo. The course is designed to expose students to carbohydrate metabolism as also understand the principles of energy generation by different physiological groups of organisms. The advanced area of bioenergetics unfolds the universal mechanisms of energy generation by using electron transport systems and gaining knowledge of energy conservation. The student is also learning alternative pathways like HMP, ED, TCA cycle.

LEARNING OUTCOMES: The students should be able to

- 1. Understand the architecture of the membrane and how solute is transported inside the cell.
- 2. Describe and explain the electron transport chains in prokaryotes and mitochondria and understand the mechanism of ATP synthesis.
- 3. Discuss the experimental aspect of studying catabolism and anabolism and the various pathways for the breakdown of carbohydrates along with reactions in amphibolic pathways.
- 4. Describe the photosynthetic apparatus, photochemical centers, ETC and mechanism of ATP synthesis.
- 5. Understand the origin and dual mechanism in cyanobacteria
- 6. Describe various other pathways which produce different end products.
- 7. Describe alternate pathways & reactions in carbohydrate synthesis.

DETAILED SYLLABUS

Course Code	Unit	Sub	Title	No of lectures	Credit
BHUSMB 503			MICROBIAL BIOCHEMISTRY – PART I	60	2.5
	I		BIOLOGICAL MEMBRANES AND TRANSPORT	15	
		1.1	Composition and architecture of membrane 1.1.1 Lipid bilayer is stable in water 1.1.2 Bilayer Architecture & function of membranes 1.1.3 Membrane proteins are receptors, transporters & enzymes 1.1.4 Major types of Membrane proteins 1.1.5 Porins 1.1.6 Aquaporins and passage of water 1.1.7 Mechanosensitive channels 1.1.8 Crypticity	3L	
		1.2	Methods of studying solute transport a. Use of whole cells b. Liposomes c. Proteoliposomes	2L	
		1.3	 Solute transport across membrane a. Passive transport and facilitated diffusion, Ion channels b. Active transport – PMF energizes active transport c. Co-transport across the membrane (uniport, symport, antiport) d. Ion gradient provides energy for secondary active transport: Lactose transport in <i>E.coli</i>, Glucose transport in epithelial cells e. P-type ATPase and transport (only Na-K ATPase) 	5L	
		1.4	Shock sensitive systems-role of binding proteins, ABC transporters, Histidine uptake	2L	
		1.5	Phosphotransferase system, Schematic representation of various membrane transport systems in bacteria	1L	
		1.6	Other Examples of solute transport a. Iron transport – A special problem b. Protein export c. Bacterial membrane fusion central to many biological processes Study: defective ion channel in cystic fibrosis BIOENERGETICS - OXIDATIVE	2L	
	II	2.1	PHOSPHORYLATION Mechanisms of metabolism (Concept, examples): Respiration (aerobic & anaerobic), fermentation, Chemolithotrophy, phototrophy	3L	

			D' 1 ' 1 1 ' C ' ATTD		
			Biochemical mechanisms of generating ATP:		
		2.2	a. Substrate level Phosphorylation		
		2.2	b. Electron transport mediated: Oxidative Phosphorylation &		
			Photophosphorylation		
			c. Mitochondria – Role in cellular respiration and Structure		
			Electron transport chain		
			a. Oxidation-Reduction reactions, electron donors &		
			acceptors, Reduction potential, redox couples, electron		
			tower		
			b. NAD+ as a redox carrier		
			c. Carriers in E.T.C.		
			Hydrogen carriers – Flavoproteins, Quinones		
			Electron carriers – Iron Sulphur proteins,		
			Cytochromes		
		2.3	Complexes in respiratory chains(mitochondrial)	7L	
			2. Association of complexes in Respirasomes		
			3. Production of reactive oxygen species during OP		
			4. Conservation of energy of electron transfer in a proton		
			gradient		
			d. Proton-motive force: Chemiosmosis, ATP synthase		
			(Structure), Rotational catalysis, Respiratory		
			Inhibitors, uncouplers of OP, ionophores of OP, ATP		
			yield & P:O ratio, Coupling sites, Roles of electron		
			transport energy.		
			Prokaryotic ETC		
			Difference between bacterial & mitochondrial respiration		
		2.4	Oxidases and reductases – types and significance	3L	
		2.4	Pattern of electron flow in <i>E. coli</i> - anaerobic and aerobic	3L	
			Anaerobic respiration – concept and examples		
			Electron flow in <i>Azotobacter vinelandii</i> – significance		
			Other modes of generating electrochemical energy:		
		2.5	Concept, mechanism and significance		
			a. ATP hydrolysis	2L	
			b. Oxalate- formate exchange		
		2.5	c. Bacteriorhodopsin		
		2.6	Bioluminescence: Bypass of respiratory electron flow		
		Self S	Study: Hot, stinking plants & alternative Respiratory pathways.		
	III		BIOENERGETICS - PHOTOPHOSPHORYLATION &	15	
	111		CHEMOLITHOROPHY		
		4.1	Introduction to photosynthesis	1L	
		4.2	Phototrophic bacteria: Oxygenic & anoxygenic	2L	
		4.3	Cyanobacteria & chloroplast	2L	
			Cyanooactoria & emoropiast		
		4.4	Photosynthetic apparatus, photochemical centers & pigments	2L	
<u> </u>	i .	1			

4.5	Photosynthetic ETC- Procaryotes, Cyanobacteria & Chloroplast	3L	
4.6	Mechanism of ATP synthesis, mechanism of energy transfer.	2L	
4.7	Evolutionary origin of dual mechanism in cyanobacteria	1L	
4.8	Inorganic metabolism & energetics of chemolithotroph Physiological Groups of chemolithotrophs, inorganic electron donors & energetics	2L	
IV	ANALYSIS OF METABOLISM & CATABOLISM OF CARBOHYDRATES	15 L	
	Metabolic concepts: Central metabolic pathways,		
	Secondary metabolic pathways, amphibolic pathways		
	Experimental Approaches to study metabolism		
	a. Metabolic inhibitors		
3.1	b. Growth studies	3L	
	c. Biochemical mutants		
	d. Isotopes in biochemical studies, omics (Definition &		
	example)		
	Catabolism of Carbohydrates		
	a. Glycolysis & overview of glycolysis (Structure & enzymes)		
	b. Feeder pathways for Glycolysis	4L	
	c. Breakdown of polysaccharides – glycogen, starch, cellulose	TL	
3.2	d. Breakdown of oligosaccharides – lactose, maltose,		
	sucrose, cellobiose		
	e. Utilization of monosaccharides – fructose, galactose		
	Alternative pathways (with structure & enzymes)		
	f. HMP pathway and ED pathway	71	
	g. TCA cycle – action of PDH, pathway, incomplete TCA,	7L	
	Anaplerotic reactions, Amphibolic role of TCA, fate of pyruvate (fermentations- Schematic), Glyoxylate bypass		
3.3	Study of glycolysis in tumors – targets for chemotherapy &		
	diagnostics	1L	
	Study of Glucose catabolism at limiting concentration of		
	oxygen		

Course Code: BHUSMBP06

[Practicals Based on BH. USMB503, Credits -1.5, Lectures- 60, Notional Periods-15]

- 1. Isolation and detection of chloroplast [Hill reaction]
- 2. Study of oxidative and fermentative metabolism
- 3. Qualitative and Quantitative assay of Phosphatase
- 4. Isolation and detection of Mitochondria
- 5. Glucose detection by GOD/POD.
- 6. Galactose transport by yeast

BIOPROCESS TECHNOLOGY - PART I [BH. USMB504]

LEARNING OBJECTIVES

Bioprocess Technology I course is designed to expose the student to different aspects if Industrial microbiology such as strain improvement, basic fermentation equipment & its sterilization aspects, Instruments associated with fermentation process etc. It gives an in depth focus of the different types of fermenters used in industry for production of different products, and also emphasizes its process parameters. It includes the principles and describes the main steps and processes in the industrial production of beverages and enzymes.

Industrial microbiology becomes an important application-based paper covering various microbial fermentations. Thus, it becomes a laboratory to market scenario where the entire products reach. The learner is provided with the details of productions of important traditional fermentation products like alcohol, vinegar, baker's yeast and enzymes.

Thus, this paper readies the learner to understand and apply the knowledge of fermentation technology and related products. The revised course of this paper also consists of basic

concepts behind biofertilizers, role of microbes as biocontrol agents, concepts of biopesticides and bioherbicides.

This course aims to enable graduates to enter industry with an appropriate level of understanding of the need for both the science and business aspects to be achievable to make a viable product and enhance their entrepreneur skills.

LEARNING OUTCOMES: The students should be able to

- Describe the applications of microbes and its strain improvement in Industrial Microbiology.
- Apply kinetic formula to determine growth and productivity parameters of batch continuous, fed batch and solid substrate fermentations
- Understand the process of inoculum development for various fermentation processes
- Explain various ingredients of fermentation media and also the concept of sterilization,
 Del factor
- Describe the design of bioreactors for different applications and its process control parameters & principle and working of some advanced instruments frequently used in fermentation studies
- Design media, growth conditions and techniques for producing and recovering different types of products of commercial value.
- Understand the importance of microbes as industrial inoculants, microbes as biocontrol agents, microbes as biopesticides.
- Learner will be well –versed with the containment and levels of containment

DETAILED SYLLABUS

Course Code	Unit	Sub unit	Title	No of lectures	Credit
BHUSMB 504			BIOPROCESS TECHNOLOGY – PART I	60	2.5
	I		UPSTREAM PROCESSING – I	15	
		1.1	 a. The improvement of industrial microorganisms b. The selection of induced mutants synthesizing improved levels of primary metabolites c. The isolation of induced mutants producing improved yields of secondary metabolites. d. The improvement of strains by modifying properties other than the yield of product e. High throughput screening methods 	9L	
		1.2	The development of inocula for industrial fermentations a. Introduction b. Criteria for ideal inoculum c. Inoculum preparation procedure:- d. Development of inocula for unicellular bacterial process e. Development of inocula for yeast process. f. Development of inocula for mycelial process	6L	

II	UPSTREAM PROCESSING – II	15
2.1	Fermentation media formulation and raw materials a. Criteria for ideal fermentation media b. Media formulation :- only criteria c. Raw materials for fermentation media	7L
2.2	 a. Sterilization and achievement of aseptic conditions b. Introduction c. Achievement of aseptic conditions d. Aseptic operation & Containment e. Medium sterilization (concept of Nabla factor) f. Methods of batch sterilization g. The design of continuous sterilization process h. Sterilization of the Fermenter i. Sterilization of the Feeds j. Sterilization of the liquid wastes Filter Sterilization:- 1. Filter sterilization of fermentation media, 2. Filter sterilization of fermenter exhaust air 	8L
III	FERMENTATION EQUIPMENT'S, INSTRUMENTS & INSTRUMENTATION	15
3.1	 Design of fermenter a. Basic functions b. Body construction c. Agitator (impeller) – function, types, d. Baffles e. The aeration system (sparger) - function and types f. Valves (Examples of all valves) g. Steam traps [function only] h. Examples of fermenters - Stirred Tank Reactor, Air Lift, Tower fermenter, Deep Jet, Photobioreactor 	8L
3.2	Instrumentation and control a. Introduction to sensors and its types b. Measurement and control of: - pH, temperature, pressure, foam sensing, dissolved oxygen, inlet and exit gas analysis	4L
3.3	Instrumentation: Principles, working and application of a. Spectrophotometry: UV, Visible & IR b. AAS & AES (Flame photometry)	3L
IV	TRADITIONAL FERMENTATIONS	15
4.1	Alcohol from Molasses Introduction, biosynthesis of ethanol production process - preparation of nutrient solution, fermentation, recovery by distillation	3L
4.2	Vinegar (Apple cider): a. Introduction, biosynthesis, b. Production using generator, c. Production using submerged fermenter, & recovery	3L

	4.3	 Baker's yeast: a. Outline of production, yeast strains and their properties, b. factors important in production-oxygen requirement and aeration, concentration of sugar, pH, temperature, c. preparation of substrate, fermentation, harvesting of yeast cells, d. Production of compressed and active dry yeast. 	3L	
	4.4	Fungal amylase production: a. Amylase- production from bacteria and fungi, b. Amylase and glucoamylase, concentration and purification.	2L	
	4.5	Agricultural Microbial inoculants industrial aspects: a. Bio fertilizer: - Rhizobium, Azotobacter, Azospirillum, PSB, BGA, Azolla. b. Biocontrol agents: Pseudomonas fluorescens, Trichoderma c. Biopesticides: - Bacillus thuringenesis, NPV d. Bioherbicides e. Inoculant formulations	4L	

Course Code: BHUSMBP06 [Practicals Based on BHUSMB504, Credits -1.5, Lectures- 60, Notional Periods-15]

1. Alcohol Fermentation

- a. Preparation and standardization of yeast inoculums for alcohol fermentation
- b. Laboratory Alcohol fermentation using jaggery medium, calculation of efficiency of fermentation.
- c. Determine the alcohol tolerance for yeast.
- d. Determine the sugar tolerance for yeast.
- 5. Chemical estimation of sugar by Cole's ferricyanide method
- 6. Chemical estimation of alcohol
- 7. Production of amylase- detection, shake flask or solid substrate cultivation and detection (Quantitative).
- 8. Isolation of bacterial biofertilizers :- *Rhizobium*, *Azotobacter*, *Azospirillum* and phosphate solubilising bacteria.

MICROBIAL GENETICS AND VIROLOGY – PART I [BH. USMB601]

LEARNING OBJECTIVES

USMB 601 is a course for T.Y.B.Sc. In Semester VI Microbiology students which deal with the following:

- 1. Extrachromosomal genetic elements & gene regulation: This module deals with the basic concepts of plasmids and its characteristics. It also covers different types of plasmids and different methods for detection and isolation of plasmids. Additionally, this module will make the students understand the genetic basis of regulation and operon control through the involvement of regulatory proteins and regulation of lytic and lysogeny in lambda phage.
- 2. **Genetic Exchange & Homologous recombination -** The student shall study the various mechanisms of gene transfer in bacteria and genetic recombination.
- 3. **Recombinant DNA technology**: This module deals with the basic steps in gene cloning, vectors, model organisms, methods of transformation and screening and identification of recombinant cells.
- 4. **Application of rDNA technology and Bioinformatics:** This module will empower the student to understand the basic techniques in Recombinant DNA technology along with their applications. Bioinformatics is the basic tool in understanding Cells at the genomic and proteomic levels. Inclusion of Bioinformatics in this module will empower the learner with insilico analytical techniques.

LEARNING OUTCOMES

- 1. **Extrachromosomal genetic elements & gene regulation:** The student will be able to understand the basic concepts of plasmids, its characteristics & detection methods. The learner will also understand the genetic basis of regulation and operon control & mechanism of regulation of lytic and lysogeny in lambda phage.
- 2. **Genetic Exchange & Homologous recombination -** The student shall understand various mechanisms of gene transfer in bacteria i.e transformation, transduction & conjugation and various models in genetic recombination in bacteria.
- 3. **Recombinant DNA technology**: The learner will understand the basic steps in gene cloning, significance and use of vectors, role of model organisms in generics & methods of transformation and screening and identification of recombinant cells.
- 4. **Application of rDNA technology and Bioinformatics:** The student will be able to understand the basic techniques in Recombinant DNA technology along with their applications. Study of bioinformatics will help the student to understand the various insilico analytical techniques.

DETAILED SYLLABUS

Course Code	Unit	Sub unit	Title	No of lectures	Credit
BH.USMB 601			MICROBIAL GENETICS, rDNA TECHNOLOGY & BIOINFORMATICS	60	2.5
	I		EXTRA CHROMOSOMAL ELEMENTS & REGULATION OF GENE EXPRESSION	15	
		1.1	Plasmids a. Physical nature b. Plasmid incompatibility, copy number and Plasmid curing c. Cell to cell transfer of plasmids d. Classification of plasmids e. Host range plasmids f. Types of plasmids: - Resistance Plasmids, Plasmids encoding Toxins and other Virulence characteristics, Col factor, Degradative plasmids g. Isolation & Detection of plasmids.	7L	
		1.2	Regulation of gene expression a. Types regulation of gene expression b. Lac operon and problems on Lac operon c. Regulation of lytic and lysogenic pathway of lambda phage	8L	
	II		GENETIC EXCHANGE & HOMOLOGOUS RECOMBINATION	15	
		2.1	Genetic analysis of bacteria	1L	
		2.2	Gene transfer mechanisms in bacteria Transformation a. Introduction and History b. Types of transformation in prokaryotesNatural transformation in <i>Streptococcus pneumoniae</i> , Haemophilus influenzae, and Bacillus subtilis. c. Artificial transformation d. Mapping of bacterial genes using transformation. e. Problems based on transformation.	3L	
		2.3	 Conjugation a. Discovery of conjugation in bacteria b. Properties of F plasmid/Sex factor c. The conjugation machinery d. F+, F prime & Hfr strains, their formation and mechanism of conjugation e. F' factor, origin and behavior of F' strains, Sexduction. f. Mapping of bacterial genes using conjugation (Wolman and Jacob experiment). g. Problems based on conjugation 	5L	
		2.4	Transduction a. Introduction and discovery	3L	

Г			<u> </u>	
		b. Generalized transduction		
		c. Use of Generalized transduction for mapping genes		
		d. Specialized transduction		
		e. Problems based on transduction		
		Recombination in bacteria		
		a. General/Homologous recombination		
	2.5	b. Molecular basis of recombination	3L	
	2.3	c. Holliday model of recombination (Single strand DNA	3L	
		break model only)		
		d. Enzymes required for recombination		
III		RECOMBINANT DNA TECHNOLOGY	15	
		Branches of genetics		
		a. Transmission genetics		
	3.1	b. Molecular genetics	1L	
	3.1			
		c. Population genetics		
		d. Quantitative genetics		
		Model organisms		
	2.2	a. Characteristics of a model organism	41	
	3.2	b. Examples of model organisms used in study	4L	
		c. Examples of studies undertaken using prokaryotic and		
		eukaryotic model organisms		
		Gene cloning		
		a. Basic step of gene cloning		
		b. Cutting and joining DNA molecules - Restriction and		
		modification systems, restriction endonucleases, DNA		
		ligases -3		
		Vectors		
	3.3	a. Plasmids as cloning vectors, plasmid vectors, pBR322	10L	
		vector, Cloning genes into pBR322		
		b. Phage as cloning vectors, cloning genes into phage vector		
		c. YAC		
		d. Cosmids [examples]		
		e. Shuttle vectors [examples]		
		f. BAC [examples]		
	3.4	Methods of transformation	2L	
	3.1		21	
IV IV		APPLICATIONS OF rDNA TECHNOLOGY &	15	
		BIOINFORMATICS PCR		
	4.1	a. Basic PCR and different types of PCR	2L	
		b. (Reverse transcriptase PCR, Real time quantitative		
		PCR)		
	4.2	Basic Techniques	21	
	4.2	a. Southern, Northern and Western blotting.	3L	
		b. Autoradiography (explain the term)		
	4.3	Screening and selection methods for identification and	2L	
	1.5	isolation of recombinant cells		
	4.4	Applications of recombinant DNA technology	3L	
		a. Site specific mutagenesis of DNA,		

	b. Uses of DNA polymorphism,		
	c. STRS and VNTRS,		
	d. DNA molecular testing for human genetic diseases		
	(Only RFLP), DNA typing, gene therapy,		
	e. Genetic engineering of plants and animals.		
	Bioinformatics		
	a. Introduction		
	b. Definition, aims, tasks and applications of		
	Bioinformatics.		
	c. Database, tools and their uses –		
	d. Importance, Types and classification of databases		
	e. Nucleic acid sequence databases- EMBL, DDBJ,		
	GenBank, GSDB, Ensembl and specialized Genomic		
	resources.		
4.5	f. Protein sequence databases-PIR, SWISS-PROT,	5L	
	TrEMBL NRL-3D. Protein structure databases-SCOP,		
	CATH, PROSITE, PRINTS and BLOCKS. KEGG.		
	g. Explain the terms: Transcriptome, Metabolomics,		
	Pharmacogenomics, Phylogenetic analysis,		
	Phylogenetic tree, Annotation, Genomics-structural,		
	functional and comparative genomics, Proteomics -		
	structural and functional proteomics, Sequence		
	alignment - global v/s local alignment, FASTA, BLAST		
	(Different types of BLAST)		

Course Code: BHUSMBP07 [Practicals Based on BHUSMB601, Credits -1.5, Lectures- 60, Notional Periods-15]

- 1. Isolation of plasmid DNA & detection by electrophoresis & spectrophotometric.
- 2. Transformation of *E. coli*
- 3. Beta galactosidase assay
- 4. Restriction digestion of lambda phage /any plasmid DNA (Demo)
- 5. Bioinformatics Practicals

On Line Practical

- 1. Visiting NCBI and EMBL websites & list services available, software tools available and databases maintained
- 2. ii. Visiting & exploring various databases mentioned in syllabus and
 - a. Using BLAST and FASTA for sequence analysis
 - b. Fish out homologs for given specific sequences (by teacher decide sequence of some relevance to their syllabus and related to some biological problem e.g. evolution of a specific protein in bacteria, predicting function of unknown protein from a new organism based on its homology)
 - c. Six frame translation of given nucleotide sequence
 - d. Restriction analysis of given nucleotide sequence
 - e. Pair-wise alignment and multiple alignment of a given protein sequences
 - f. Formation of phylogenetic tree

MEDICAL MICROBIOLOGY & IMMUNOLOGY – PART II [BH. USMB602]

LEARNING OBJECTIVES

This course is designed to highlight various emerging infectious diseases and the mechanisms used by pathogens to evade immune response. It covers characteristics, virulence factors, prevention and treatment regimen related with a number of infectious diseases in humans. The course will provide the conceptual basis for understanding various emerging infectious diseases and the strategies used by pathogens to circumvent the immune system of the host. The students have achieved a basic understanding of Innate Immunity and innate defence mechanisms in their lower classes and Immunology that forms an integral part of this course has been designed to help understand the concepts of humoral and cellular immune response which forms the second arm of the immune system i.e Acquired Immune response. Furthermore, it will also provide opportunities for a student to develop diagnostic skillset in microbiology, including the practical application and interpretation of basic laboratory tests conducted in analysis laboratories in the field of medical microbiology and immunology.

LEARNING OUTCOMES

After completing this course, the student should be able to

1. Give details of the virulence factors and other features of the pathogen

- 2. Correlate these virulence factors with the pathogenesis and clinical features of the disease
- 3. Explain the prevention and treatment of infectious diseases
- 4. Understand various mechanisms used by pathogens to evade immune response
- 5. Understand the concept of vaccination and explain the various types of vaccines
- 6. Understand the structure and role of T and B cells in generating adaptive immunity and thereby study effector responses in both Humoral & Cell Mediated Immunity
- 7. Conceptualize how the adaptive immune responses coordinate to fight invading pathogens.

Course Code: BH.USMBP07 [Practicals Based on BH. USMB602, Credits -1.5, Lectures- 60, Notional Periods-15]

- 1. To determine SLO and SLS activity of S.pyogenes
- 2. Study of standard [pure] cultures of E. coli, Klebsiella spp., Proteus spp., Pseudomonas spp., Salmonalla typhi, S. paratyphi A, S. paratyphi B, Shigella spp., Vibrio spp., S. pyogenes, S. aureus
- 3. Identification of isolates obtained from pus, sputum, stool and urine by morphological, cultural, biochemical properties and determination of antibiotic sensitivity.
- 4. *Candida albicans* Isolation on Chrome Agar and Germ tube formation
- 5. Separation and detection of lymphocytes.

MICROBIAL BIOCHEMISTRY-PART II (BH.USMB 603)

LEARNING OBJECTIVES

Having studied many aspects of microbial physiology in the earlier semester, contents of this semester is designed to understand anabolism of carbon, dark reaction, metabolism of lipid and aliphatic compounds. Since all biosynthetic pathways are denovo or salvage, the vital regulatory role played by enzymes is understood. Various levels and mechanisms of regulation are dealt to make the learner aware of coordinated mechanisms of metabolism in the living cell. The students will also be exposed to basic concepts of operons with examples, riboswitches and global regulatory mechanisms. Also genetic regulation mechanisms in eukaryotic cells will be covered in this module.

LEARNING OUTCOMES: At the end of the course in Microbial Biochemistry; USMB 603, the learner will have an understanding of the following metabolic process and mechanisms and their significance.

- 1. Anabolism of carbon
- 2. Dark reaction
- 3. Biosynthesis of starch, cellulose and sucrose
- 4. Metabolism of lipids and aliphatic compounds
- 5. Metabolism of nitrogenous compounds
- 6. Catabolism of nucleotides
- 7. Major modes of regulation of gene expression

DETALED SYLLABUS

Course Code	Unit	Sub unit	Title	No of lectures	Credit
BHUSMB 603			MICROBIAL BIOCHEMISTRY – PART II	60	2.5
	I		Anabolism of carbon	15	
			The strategy of biosynthesis, Composition of <i>E. coli</i> cells, general pattern of metabolism leading to synthesis of a cell from glucose	1L	
		1.1	CO2 fixation (Dark reactions)-Phototrophs Calvin Benson cycle Reductive TCA cycle	2L	
		1.2	Biosynthesis of Starch, Cellulose & Sucrose	2 L	
		1.3	Importance of Sugar nucleotides	1L	
		1.4	Gluconeogenesis	1L	
		1.5	Biosynthesis of periodic macromolecules: Glycogen, cell wall-peptidoglycan, outer membrane layer	4L	
		1.6	Synthesis of PHB		
	II		Metabolism of lipids & aliphatic compounds		
		2.1	Introduction to Lipids	4L	

		Lipids –Definition, classification & functions	
		Types and role of fatty acids found in bacteria	
		Common phosphoglycerides in bacteria	
		Action of lipases on triglycerides /tripalmitate	
		Oxidases, Oxygenases, CytP450 enzymes	
	2.2	Catabolism of Fatty Acids and PHB	3L
		Oxidation of saturated fatty acid by β oxidation & energetics	
		PHB as a food reserve and its degradation	
	2.3	Anabolism of Fatty Acids & Lipids Biosynthesis of straight chain even carbon saturated fatty acid(palmitic acid) Biosynthesis of phosphoglycerides in bacteria	4L
	2.4	Catabolism of aliphatic hydrocarbons Organisms degrading aliphatic hydrocarbons Hydrocarbon uptake mechanisms Omega oxidation pathway- Pathway in <i>Corynebacterium</i> and yeast Pathway in <i>Pseudomonas</i>	4L
III		Metabolism of nitrogenous compounds	15
	3.1	Protein / amino acid catabolism Enzymatic degradation of proteins, putrefaction General reactions of amino acids catalyzed by Amino acid decarboxylases Amino acid deaminases Amino acid transaminases Amino acid racemases Metabolic fate of amino acids - Glucogenic and ketogenicamino acids	4L
	3.2	Fermentation of pair of amino acids -Stickland reaction	1L
	3.3	Anabolism of amino acids Schematic representation of amino acid families	
		Biosynthesis of amino acids of Serine family (Serine, Glycine, cysteine)	2L
	3.4	Nitrogen cycle, Nitrogen fixation, Denitrification, Ammonia fluxes & nitrification Nitrogen excretion & Urea cycle	3L
	3.4	Catabolism of Nucleotides	3L
		Degradation of purine nucleotides up to uric acid formation	
		Salvage pathway for purine and pyrimidine nucleotides	
	3.5	Biosynthesis of nucleotides (ribonucleotides & deoxyribonucleotides) & role of nucleotides	2L

IV		Metabolic Regulation	15L	
	4.1	Overview of regulation: Major modes of regulation Regulation of enzyme activity Allosteric proteins & Feedback inhibition	3L	
		Covalent modification of enzymes Monocyclic cascades, examples of covalent modification Regulation of Glutamine synthetase		
	4.2	Principles of gene regulation	3L	
		Proteins & RNAs of Gene Regulation		
		Concept of an operon, Common patterns of regulation of transcription: Repression & Induction. Regulation by: DNA-binding proteins, protein-protein interaction		
	4.3	Maltose operon, Attenuation & Trp operon	3L	
		Riboswitches: Enzyme cofactor TPP, amino acid-Lysine, Purine, Nucleotide base group	2L	
	4.4	Global regulatory mechanisms: catabolite repression, Stringent response, alarmones	2L	
	4.5	Regulation of gene expression in Eucaryotes: chromatin structure, histone modification, gene silencing	2L	

Course Code: BHUSMBP08

[Practicals Based on BH.USMB603; Credits-1.5, Lectures- 60, Notional Periods-15]

- 1. To study catabolite repression by diauxic growth curve.
- 2. Protein estimation by Lowry's method
- 3. Estimation of uric acid from serum and urine sample.
- 4. Qualitative and Quantitative assay of Protease
- 5. Qualitative detection of Lipase
- 6. Study of breakdown of amino acids Lysine decarboxylase.
- 7. Study of Lithotrophs Nitrosification and Nitrification.

BIOPROCESS TECHNOLOGY - PART II [BH. USMB604]

LEARNING OBJECTIVES

Bioprocess Technology II is designed to develop the learner's ability to study the techniques use in the downstream process used for the final product and industrial effluent treatment. Bioprocess technology II becomes an important application-based paper covering microbial fermentations as well as applying the techniques of molecular biology to enzyme technology, animal tissue culture as well as plant tissue culture. The learner is provided with the details of productions of important products like antibiotics, vitamins, organic acid, amino acids and mushrooms along with the analysis techniques using various instruments and bioassays.

The learner is expected to learn the need of Quality management and regulatory bodies as the products need to fulfil these requirements. Thus, this paper prepares the learner to understand and apply the knowledge of fermentation technology and related products. This course aims to enable graduates to enter industry with an appropriate level of understanding of the need for both the science and business aspects to be achievable to make a viable product and enhance their enterpreunial skills.

LEARNING OUTCOMES: The student will be able to

- Understand the actual process involved in downstream processing of important products.
- Understand the importance of effluent treatment and explain the newer methods of sewage treatment
- To apply the knowledge of applications of animal and plant tissue culture techniques.
- Learn the applications of immobilized enzymes in various fields.
- Understand the working of important instruments used in biochemical analysis and bioassay.
- Learn the salient features of quality management and regulatory procedures.

At the end of the course the learner will also acquire the following practical skills

- Techniques involved in running a bioassay, immobilization of cells & sterility testing
- Preliminary techniques in animal & plant tissue culture

DETAILED SYLLABUS

Course Code	Unit	Sub unit	Title		Credit
BHUSMB 604			BIOPROCESS TECHNOLOGY – PART II	60	2.5
	I		POST FERMENTATION PRODUCTION TECHNIQUES	15	
		1.1	Post Fermentation Production Techniques a. Introduction b. Downstream processing c. Disintegration of cells, Extraction, Concentration, purification, drying, Whole Broth Processing	10L	
		1.2	 Effluent treatment a. Introduction, b. Dissolved oxygen concentration as indicator of water quality c. The strength of fermentation effluents d. Newer approaches to sewage treatment 	5L	
	II		ADVANCES IN BIOPROCESS TECHNOLOGY	15	
		2.1	Animal biotechnology a. Primary cell culture and established cell lines b. Basic principles c. Growth media d. Cell viability e. Scale up of cultured cells and tissue f. Applications of cell culture: Monoclonal antibody, somatic cell fusion, valuable products.	5L	
		2.2	 Plant tissue culture a. Introduction b. Requirements for in vitro culture, Methods of plant cell and tissue culture c. Types of cultures of plant materials: explants, callus, organogenesis, root culture, shoot culture, micropropogation, suspension culture, protoplast culture, protoplast fusion and somatic hybridization d. Applications:- production of disease resistant plants, production of virus free plant, 	5L	

		In vitro selection of cell lines for disease resistance,		
		micropropogation, secondary metabolites from cell		
		culture, transgenic plants for crop improvement		
		Immobilized enzyme and cells		
		a. Introduction and Definitions		
	2.3	b. Methods	5L	
		c. Immobilized Enzyme Reactors		
		d. Applications		
III		QUALITY ASSURANCE, IPR AND BIOASSAY	15	
		Quality assurance and quality control		
		a. Definitions, Chemical and pharmaceutical products		
		b. Variables of batch process		
	3.1	c. Q.A and Q.C wrt Raw materials, method of	7L	
		manufacturing, in process items, finished products, label		
		and labeling, packaging materials		
		d. Control of microbial contamination during manufacturing		
	3.2	Sterilization control and assurance	2L	
		Bioassay		
	3.3	a. Introduction	3L	
	3.3	b. Types: Diffusion, End Point, Turbidometric, Metabolic	311	
		Response, Enzymatic assay.		
		Intellectual property rights		
		a. IPR – Introduction		
	3.4	b. Overview of patent system	3L	
		c. Patent Categories		
		d. For biotech and microbiological products		
IV		INDUSTRIAL FERMENTATIONS	15	
		Penicillin and semisynthetic penicillins:		
		a. Introduction, biosynthesis and regulation, strain		
	4.1	development, production methods.	3L	
		b. Semisynthetic penicillins: Examples, production,		
		advantages		
		Aminoglycoside: Streptomycin:		
	4.2	a. Aminoglycoside antibiotics, biosynthesis, regulation of	3L	
		biosynthesis, strain development, production method,		
		recovery.		
		Vitamin B 12:		
	4.3	a. Occurrence and economic significance, structure,	2L	
	1.5	biosynthesis,		
		b. Production based on media containing carbohydrates by-		
		Propionibacteria and Pseudomonas, recovery.		
		Citric acid:		
	1 1	a. Introduction,	3L	
	4.4	b. Strains used for production, biosynthesis, nutrient media		
		c. Production processes- surface and submerged, product		
	4.5	recovery.	2L	
	4.3	Glutamic acid	2L	
	<u> </u>			

		a. Production strains, biosynthesis, effect of permeability on production.		
		b. Conditions of manufacturing, production process and		
		recovery.		
		c. Introduction to dual fermentation.		
		Mushroom cultivation (Agaricus):		
		a. Edible mushroom species,		
	4.6	b. preparation of substrate- composting- phase I and phase II,	2L	
		Factors affecting composting,		
		c. preparation of spawn, casing, induction of fruiting body		
		formation, harvesting		

Course Code: BHUSMBP08

[Practicals Based on BHUSMB604, Credits -1.5, Lectures- 60, Notional Periods-15]

- 1. Bioassay of an antibiotic (Ampicillin / Penicillin)
- 2. Bioassay of Cyanocobalamin.
- 3. Perform immobilization of yeast cells for invertase activity making of beads, Determination of activity and count by haemocytometer and viable count.
- 4. Plant tissue culture Callus culture (Demo).
- 5. Sterility testing of injectable.
- 6. Chemical estimation of Penicillin / Ampicillin
- 7. Industrial Visit

Modality of Assessment Assessment pattern for Theory

Theory Examination Pattern:

A) Internal Assessment- 40%- 40 Marks

Sr. No.	Evaluation type	Marks
1	Internal Class Test with Objective type questions and Short Notes (CIA-I) (5 mark test on every unit of each paper)	20
2	(CIA-II) Assignment, Model making, Poster making of syllabus related topic, Internship, Project work	20
_	TOTAL	40

B) External Examination- 60%- 60 Marks Semester End Theory Examination: 60 marks (for offline Mode)

Duration - The examinations shall be of **2 hours** duration.

Paper Pattern:

- 1. There shall be **05** questions of **12** marks each.
- 2. The first question will be a mixed bag objective and remaining four questions will be unitized subjective.
- 3. Each of the main questions two to five will be subdivided into two sub-questions "A" and "B". Sub-question "A" will have four questions (of 5 marks each) out of which any two will be attempted. Total marks allotted to sub-question "A" will be 10 marks. Sub-question "B" will be 'Do as directed (attempt two out of four)'. Each question in Sub-question "B" will be of one mark each. Total marks allotted to "B" sub-question will be 2 marks.
- 4. All questions [Q.2 to Q.5] shall be compulsory with internal choice within questions except first question [Q.1].
- 5. The unitized questions would have subjective and objective type of questions.

Overall Examination & Marks Distribution Pattern

Semester V & VI

Course BH. USMB	501 , 502 ,503 & 504		, ,			601 , 602 ,603 & 604			Grand total
	Internal	External	Total	Internal	External	Total			
Theory	160	240	400	160	240	400	800		
Practical	-	200	200	-	200	200	400		
Total	Total						1200		

Rubrics of evaluation for ESE

Unit	Knowledge	Understanding	Analysis & critical thinking	Total marks/unit
From all units	04	04	04	12
1	04	04	04	12
2	04	04	04	12
3	04	04	04	12
4	04	04	04	12
Total	20	20	24	60
% Weightage	33.33	33.33	33.34	100

Passing Standard:

The learners to pass a course shall have to obtain a minimum of 40% marks in aggregate for each course and 40% marks in **Semester End Examination** (i.e. 40 out of 100) separately, to pass the course and **minimum of Grade E** in each project, wherever applicable, to pass a particular semester.

Practical Examination Pattern:

External (Semester end practical examination):-

Sr.No.	Particulars/ paper	Marks
1.	Laboratory work	40
2.	Journal	05
3.	Viva	05

Semester V:

The students are required to present a duly certified journal for appearing at the practical examination, failing which they will not be allowed to appear for the examination.

In case of loss of Journal and / or Report, a Lost Certificate should be obtained from the Head of the Department / Co-ordinator of the department; failing which the student will not be allowed to appear for the practical examination.

Semester VI

The students are required to present a duly certified journal for appearing at the practical examination, failing which they will not be allowed to appear for the examination.

In case of loss of Journal and/ or Report, a Lost Certificate should be obtained from the Head of the Department/ Co-ordinator of the department; failing which the student will not be allowed to appear for the practical examination.
